

# Append UTMs upon DOM change

Here is an example of snippet you can use to append UTMs upon a DOM change. This requires advance coding skills.

```
setTimeout(function(){
var target = document.querySelector('#storepoint-results')var observer = new
MutationObserver(function(mutations) {console.log(jQuery(target).find('.storepoint-
onlinestore').length)
  if ( jQuery(target).find('.storepoint-onlinestore').length > 0 ){   var a =
jQuery(target).find('.storepoint-onlinestore')
    var target_url = a.attr('href')   var merged = jQuery.extend( {}, handl_utm,
getSearchParams(target_url) )
    var src = target_url.split("?")[0];
    if ( !jQuery.isEmptyObject(merged) ){   var final_target = src + "?" +
jQuery.param(merged)
      }
      a.attr('href', final_target)
    }
});var config = { attributes: true, childList: true, characterData: true };
observer.observe(target, config);
}, 500);
```
