

# Capture UTMs using Formstack forms (V4) - Old

This form is only compatible with HandL UTM Grabber V3.

Please add the hidden fields as outlined below. Ensure that the hidden field name (either the field label or placeholder) exactly matches our naming convention detailed here: [Native WP Shortcodes](#).

The screenshot displays the Formstack V4 form builder interface. The top navigation bar includes tabs for Forms, Uncategorized, and a specific form named 'handl'. The main interface is divided into a left sidebar and a central canvas. The sidebar contains a 'Logic' section and a 'Field-Specific' section. The 'Field-Specific' section has options for 'Create Custom List' and 'Link to Smart List', with a dropdown menu for selecting a smart list. The 'Field-Specific' section also includes an 'Autocomplete Editor' and 'FIELD SIZE' settings. The central canvas shows a form titled 'Sign up for our newsletter!' with a description 'Fill out your information below to be signed up for our informative newsletter.' The form includes a 'Name' field, an 'Email' field, and several hidden fields: 'utm\_campaign', 'utm\_source', 'utm\_medium', and 'organic\_source\_str'. Each hidden field is labeled 'Hidden' and has its name and value displayed. The 'utm\_campaign' field has a value of 'utm\_campaign'. The 'utm\_source' field has a value of 'utm\_source'. The 'utm\_medium' field has a value of 'utm\_medium'. The 'organic\_source\_str' field has a value of 'organic\_source\_str'.

As of version 3.0.59, you do not need to perform any additional steps, as Formstack V4 is natively supported.

If you are using HandL UTM Grabber 3.0.58 and below. Then proceed with the following step:

Upon activating the UTM Grabber V3 plugin, insert the following code into your custom JavaScript file:

```
setTimeout(function(){
```

```

    handl_utm_all_params.map(function(v){      var element = document.querySelector('.fsForm
[placeholder="'+v+'"]')
        if (element){
            var curVal = Cookies.get(v) ?? "";          var event = new Event('input', {
bubbles: true })
            var previousValue = element.value
            element.value = curVal
            element._valueTracker.setValue(previousValue)
        element.dispatchEvent(event)
        }
    })
}, 500)

```

This code will automatically populate the fields after a lead is submitted.
