

Capture UTMs using Formstack forms (V4) - Old

This form is only compatible with HandL UTM Grabber V3.

Please add the hidden fields as outlined below. Ensure that the hidden field name (either the field label or placeholder) exactly matches our naming convention detailed here: [Native WP Shortcodes](#).

The screenshot displays the Formstack V4 form builder interface. The top navigation bar includes 'Forms', 'Uncategorized', 'handl', 'Build', 'Conversion Kit', 'Settings', 'Share', 'Submissions', and 'Analytics'. The left sidebar contains a 'Logic' section and a 'Field-Specific' section. The main canvas shows a form titled 'Sign up for our newsletter!' with the following fields:

- General:**
 - FIELD LABEL: utm_campaign
 - SUPPORTING TEXT: utm_campaign
 - Use Callout: ☐
 - PLACEHOLDER: utm_campaign
 - Required: ☐ Hidden: ☒ Read-only: ☐ Unique: ☐ Hide Label: ☐
 - SAVE THIS FIELD FOR REUSE LATER:
- Field-Specific:**
 - Create Custom List: ☐ Link to Smart List: ☒ -- Select Smart List to Link --
 - Autocomplete Editor:
 - FIELD SIZE: Minimum Characters: 0, Maximum Characters: 0

The form fields are:

- Name:** A text input field.
- Email:** A text input field.
- Hidden utm_campaign:** A text input field with the label 'utm_campaign' and placeholder 'utm_campaign'.
- Hidden utm_source:** A text input field with the label 'utm_source' and placeholder 'utm_source'.
- Hidden utm_medium:** A text input field with the label 'utm_medium' and placeholder 'utm_medium'.
- Hidden organic_source_str:** A text input field with the label 'organic_source_str' and placeholder 'organic_source_str'.

As of version 3.0.59, you do not need to perform any additional steps, as Formstack V4 is natively supported.

If you are using HandL UTM Grabber 3.0.58 and below. Then proceed with the following step:

Upon activating the UTM Grabber V3 plugin, insert the following code into your custom JavaScript file:

```
setTimeout(function(){
```

```

    handl_utm_all_params.map(function(v){      var element = document.querySelector('.fsForm
[placeholder="'+v+'"]')
    if (element){
        var curVal = Cookies.get(v) ?? "";      var event = new Event('input', {
bubbles: true })
        var previousValue = element.value
        element.value = curVal
        element._valueTracker.setValue(previousValue)
    element.dispatchEvent(event)
    }
    })
}, 500)

```

This code will automatically populate the fields after a lead is submitted.
